

Full-stack Developer with 3+ years of experience building and scaling high-throughput systems. Strong in **backend architecture, distributed systems**, and performance optimisation, with a focus on reliability and maintainability. Proven track record of delivering production-grade solutions and resolving complex issues in large-scale environments.

TECHNICAL SKILLS

- **Languages:** Java, JavaScript, SQL
- **Backend:** Spring Boot, Spring Cloud Gateway, Maven, REST APIs
- **Frontend:** React.js, HTML, CSS
- **Databases & Messaging:** PostgreSQL, MySQL, Redis, RabbitMQ, MinIO
- **Cloud & DevOps:** AWS (EC2, S3), Docker, NGINX, CI/CD (Jenkins, GitHub Actions), Linux, Git
- **Observability:** Splunk, AppDynamics, Dynatrace
- **Architecture & Design:** Microservices, Distributed Systems, API Security (OAuth2/JWT)

WORK EXPERIENCE

Fedex, Hyderabad, India

Full Stack Developer (Oct, 2025 - Present)

Stack: Spring Boot, Jenkins, Github Actions, Splunk, AppDynamics, Azure, Cloud

- **Shipment Foundational Systems** — core backend team owning microservices that process shipment modification workflows (hold requests, address changes, fraud alerts, last-mile routing) at a global scale across **100K+ daily transactions**, peaking at **millions** of requests during peak seasons.
- Implemented business logic for an international expansion feature across **5 microservices**, coordinating cross-team API contracts, maintaining strict backward compatibility, and validating end-to-end flows across dependent services.
- Refactored 3 legacy service modules as part of **architectural modernisation**, aligning with current microservices standards, and navigating zero-downtime constraints and deep service interdependencies in a live, high-throughput system processing millions of shipments.
- Debugged 15+ production incidents using **Splunk, AppDynamics & Dynatrace**, performed root cause analysis across **distributed service traces**, and documented preventive fixes, directly reducing repeat failure rates in a system with global delivery SLA obligations.
- Authored and maintained **CI/CD pipelines (Jenkins & GitHub Actions)** — pipeline scripting, build optimisation, and migration from Jenkins to GitHub Actions workflows directly supporting continuous delivery with zero tolerance for deployment failures.
- Worked on **cloud infrastructure** to deploy, configure, and manage services across multiple hosted environments.

C-DAC, Hyderabad, India

Project Associate → Project Engineer (May, 2023 - Oct, 2025)

Stack: Spring Boot, Spring Cloud Gateway, RabbitMQ, Redis, PostgreSQL, MySQL, Docker, NGINX · AWS, React.js

- **National-scale platform:** End-to-end backend for accreditation platform & SaaS LMS — multiple microservices in a small team with 99.5%+ uptime under sustained concurrent load.
- Built a centralised **Spring Cloud Gateway** integrating with Keycloak (**OAuth2/JWT**), RBAC, rate limiting, and custom reactive filters; implemented Redis-based token caching, cutting cross-service authentication latency by **~35%** and reducing redundant identity lookups.
- Built a distributed file management service (Spring Boot + **MinIO on multi-node Docker Swarm** with NGINX load balancing), providing version-controlled, S3-compatible document storage for **~12 TB** files with on-premise infrastructure — replaced a brittle legacy file-server approach.
- Async & Caching: RabbitMQ pipelines + Redis — increased throughput by **~45%** and cut avg API response time from **~400 ms** → **~180 ms** under peak load.
- **Optimised PostgreSQL and MySQL:** Composite indexing, query rewriting, read-replica setup — reduced **P95 query latency by ~50%** under high-concurrency and batch workloads, zero-downtime rolling deployments across on-prem & **AWS (EC2/S3)** via Docker + NGINX.
- **Scaling & Deployment:** Scaled stateless microservices horizontally via Docker Swarm (docker service scale) to handle **3-4x traffic** spikes during peak usage periods; maintained **zero-downtime rolling deployments** across on-prem and **AWS (EC2)** via Docker Swarm + NGINX.
- **React.js (LMS Frontend):** Built modular, component-driven SPAs using React.lazy, Suspense, and route-based code-splitting; developed a shared reusable component library adopted across all core LMS modules — standardising UI patterns and cutting dev time per feature.
- **Frontend Performance:** Reduced initial bundle size by **~35%** via Webpack optimisation and tree-shaking; improved First Contentful Paint and Time-to-Interactive under low-bandwidth conditions — directly resolving recurring UI performance complaints reported across releases.

EDUCATION

National Institute of Science and Technology | 2018-2022

Bachelor of Technology in Computer Science – **9 CGPA**
